Revision	Date	Description
16.30.1004	March 31, 2021	Initial release of this Release Notes version, This version introduces Changes and New Features and Bug Fixes.

2 Overview

Firmware which is added at the time of manufacturing, is used to run user programs on the device and can be thought of as the software that allows hardware to run. Embedded firmware is used to control the functions of various hardware devices and systems, much like a computer's operating system (OS) controls the function of software applications. Firmware may be written into read-only memory (ROM), erasable programmable read-only memory (EPROM) or flash memory.

4 Changes and New Features

4.1 Important Notes

⚠ Security Hardening Enhancements: This release contains important reliability improvements and security hardening enhancements. Mellanox recommends upgrading your devices firmware to this release to improve the devices' firmware security and reliability.

⚠ When upgrading or changing the configuration on multi-host adapter cards, for the changes to take effect, PCIe restart must be simultaneously sent from both hosts (servers).

To do so, perform the following:

1. Shut down the server with the auxiliary card.
2. Shut down the server with the primary card.
3. Bring back the server with the primary card.
4. Bring back the server with the auxiliary card.

⚠ SR-IOV - Virtual Functions (VF) per Port - The maximum Virtual Functions (VF) per port is 127. For further information, see RoCE Limitations.

⚠ It is recommended to enable the "above 4G decoding" BIOS setting for features that require a large amount of PCIe resources (e.g., SR-IOV with numerous VFs, PCIe Emulated Switch, Large BAR Requests).

4.2 Changes and New Feature in this Firmware Version

Feature/Change	Description
16.30.1004	
RoCE, Lossy, slow_restart_idle	Removed triggering unexpected internal CNPs for RoCE Lossy slow_restart_idle feature.
Performance: Steering	Added support for a new NV config mode `"icm_cache_mode_large_scale_steering"` that enables less cache misses and improves performance for cases when working with many steering rules. This capability is enabled using the mlxconfig parameter `"ICM_CACHE_MODE"`.
VF/VF-group rate-limiting	This new capability enables VF/VF-group rate-limiting while per-host rate-limiter is also applied.
NvConfig: Sub-Functions	This new capability enables asymmetric Sub-Function configuration. It expands the asymmetric Sub-Function configuration to support asymmetric configurations between all PFs, and provides Sub-Function scalability and asymmetric NV configurations.

Feature/Change	Description
16.30.1004

9 Changes and New Feature History

⚠ This section includes history of changes and new feature of 3 major releases back. For older releases history, please refer to the relevant firmware versions.

Feature/Change	Description
16.29.2002	
Reserved QPN	**[Beta]** This capability allows the software to reserve a QPN that can be used to establish connection performed over RDMA_CM, and provide the software a unique QP number. Since RDMA_CM does not support DC, by using CREATE_QPN_RESERVED_OBJECT the software can reserve a QPN value from the firmware's managed QP number namespace range. This allows multiple software processes to hold a unique QPN value instead of using UD-QPs.
Bug Fixes	See Bug Fixes section.
16.29.1016	
Multi-Application QoS per QP	Added the option to allow applications to build their own QoS tree over the NIC hierarchy by connecting QPs to responder/ requestor Queue Groups.
InfiniBand Support in RDE	Added "InfiniBand" properties set to the Network Device Function Redfish object.
HW Support for Flow Metering	Added HW support for Flow Metering to utilize Advanced Steering Operation (ASO). HW Flow Meter allows higher scale, more accuracy, and better performance compare to the FW Flow Metering.
HW Offloads Enablement on VF	Added trust level for VFs. Once the VF is trusted, it will get a set of trusted capabilities.
Mini CQE Formats	Added 2 new Mini CQE formats: • Responder Mini CQE With Flow Tag Layout • Responder Mini CQE With l3_l4_info Layout
Enabling Adaptive-Routing (AR) for the Right SL via UCX	UCX can now enable AR by exposing Out-Of-Ordering bitmask per SL with `"ooo_per_sl"` field in the HCA_VPORT context. It can be also queried by running the `QUERY_HCA_VPORT_CONTEXT` com mand.
Connection Hashing	Added support for steering DP hash flow groups.
Ethernet wqe_too_small Mode	Added a new counter per vPort that counts the number of packets that reached the Ethernet RQ but cannot fit into the WQE due to their large size. Additionally, we added the option to control if such packet will cause “CQE with Error” or “CQE_MOCK”.
PCIe	PCIe Rx modifications to prevent the adapter cards from disappearing from the system.
Access Registries	`ignore_flow_level` is now enabled by the TRUST LEVEL access registry.

Counters	Added support for the `cq_overrun` counter. The counter represents the number of times CQs enter an error state due to overflow that occur when the device tries to post a CQE into a full CQ buffer.
Pause Frames from VFs	**[Beta]** Enabled the capability to allow Virtual Functions to send Pause Frames packets.
Auto-Sensing	Enabled 10/25GbE auto-sensing with 3rd party when using 10/25GbE optical cables.
Steering Dump	Hardware steering dump output used for debugging and troubleshooting. Please see Known Issue 2213356 for its limitations.
16.28.2006	
Sub Function (SF) BAR Size	Increased the minimum Sub Function (SF) BAR size from 128KB to 256KB. Due to the larger SF BAR size, for the same PF BAR2 size, which can be queried/modified by LOG_PF_BAR2_SIZE NV config, the firmware will support half of the SFs. To maintain the same amount of supported SFs, software needs to increase the LOG_PF_BAR2_SIZE NV config value by 1.
VXLAN Extension Header	This feature enables the user to define their own VXLAN extensions for the VXLAN header. The last byte of the VXLAN header is used as a length value for the private extension headers that comes after the VXLAN headers. This VXLAN extension header is supported when the "flex_parser_profile_6_supported" parameter is configured.
GPUDirect in Virtualized Environment	Enabled a direct access to ATS from the NIC to GPU buffers using PCIe peer-to-peer transactions. To enable this capability, the “p2p_ordering_mode” parameter was added to the NV_PCI_CONF configuration. **Note:** When SECURE_ALL or SECURE_TRUST is configured, ATS and RO must be set identically. When SECURE_NONE is configured, ATS and RO may be set independently as the current firmware behavior allows.
Non-Volatile Configurations	Added a new Non-Volatile Configuration parameter to control VL15 buffer size (VL15_BUFFER_SIZE). **Note:** VL15 buffer size enlargement will decrease all other VLs buffers size.
NC-SI	Added a new NC-SI command (get_device_id) to report a unique device identifier.
NC-SI	Added new NC-SI commands (`get_lldp_nb, set_lldp_nb`) to query the current status of LLDP and to enable/disable it.
ROCE ACCL	Split the SlowRestart ROCE_ACCL into the following: • `slow-restart` - used to reduce rate on retransmission events • `slow-restart-after-idle` - used to reduce rate before first transmission after >1s without transmitting
ROCE ACCL	Enabled TX PSN window size configuration using LOG_TX_PSN_WINDOW NVconfig parameter. **Note:** Due to hardware limitations, `max log_tx_psn_win` value can be set 9.
Bug Fixes	See Bug Fixes.

16.28.1002	
Flow Sampling and Mirroring	Added support for flow sampling and mirroring with an associated capable software.
Hardware Tag Matching	Increased the maximum XRQ number to 512.
Non-Volatile Configurations (NVCONFIG)	Added the following new mlxconfig parameters to the Non-Volatile Configurations section. • `log_max_outstandng_wqe` • `ece_disable_mask`
NC-SI 1.2 New Commands	Implemented the following new commands from NS-SI 1.2 specification: • Get IB Link Status • Get IB Statistics • Get PF Assignment
Resourcedump	Added the following segments, as appeared in the PRM, to the Resource Dump: • PRM_QUERY_QP • PRM_QUERY_CQ • PRM_QUERY_MKEY • QUERY_VNIC_ENV
Bug Fixes	See Bug Fixes.
16.27.2008	
Parallel VF init/Teardown Performance Optimization	Improved init_hca performance in Parallel Function initialization.
Bug Fixes	See Bug Fixes.
16.27.1016	
RoCE Selective Repeat	RoCE Selective Repeat introduces a new QP retransmission mode in RoCE: recovery from packet drop by resending the dropped packet and not only all the PSN window (Go-Back-N protocol), This new capability comes with the following limitations: • Selective repeat cannot be used with AR • Does not work with signature (T10-DIF) • Does not work with Tag Matching enabled
RedFish (RDE)	Allows BMC to query and control NIC over RedFish API (https://www.dmtf.org/standards/redfish). Currently, the NIC supports reading data and setting basic Ethernet and InfiniBand parameters.
Power Consumption	Removed power consumption limitation. This new capability removes the necessity to disable the port due to insufficient power. When this feature is enabled, an event will be sent on every transition between the following power states: • Power limit is not advertised • Sufficient power detected • Insufficient power detected
ECMP with RoCE Traffic	Enables matching of source_vhca_port in the FDB flow for ECMP hardware offload on a single FDB.
Live Firmware Patch (LFWP)	Firmware can be patched with critical bugs fixes live with minimal serviceability impact. The patching can be down only within the same major branch.

Hardware Offloaded Rules (Resource Dump)	Added support for dumping hardware steering entries (raw data) using the resource dump API.
VF Command Failure Resource Dump Event	Enables the device to generate events that will notify the user about any resource dumps updates. The resource dump owner (PF/ECPF) will be notified on the VF command failures by events that will contain the needed information to call the resource_dump command. The device will dump the resource in the standard resource dump sequence.
GTP-U Tunneled Packets	Added support for RSS based on inner headers of GTP-U tunneled packets.
Link Down Counter	The `eth_link_down_counter` now counts logical link downs as well.
Relaxed Ordering Read	**[Beta]** Added support for relaxed ordering read when using the create_mkey flag. **Note:** This capability is not supported when using Multi-Host cards and when in PCIe-Switch mode.
Bug Fixes	See Bug Fixes.
	Rev. 16.26.4012
Globally Disable RoCE through MST	Enables the user to globally disable RoCE on init by writing to the access register NCFG_REG.
Zero-Touch RoCE (ZTR) Slow Start	Enabled Zero-Touch RoCE (ZTR) slow start capability for responder flows.
Resource Dump	Extracts and prints data segments generated by the firmware.
Lossless Hairpin QP	Hairpin QP buffer is now available in Flow Control. Host Chaining now supports full fairness between several devices.
Bug Fixes	See Bug Fixes History.
	Rev. 16.26.2002
Bug Fixes	This version included a bug fix for OPN MCX562A-ACA. For further information see Bug Fixes History.
	Rev. 16.26.1040
Address Translation Service (ATS)	Added Address Translation Service (ATS) support for MKEY and UMEM.
VPD	Added support for exposing the VPD on the VF.
ICMD and Diagnostic Counters	Enabled the firmware by using the ICMD commands to deal with diagnostic counters similar to cmdif. They can be called via the vsec space. The counters' values are returned only via the tracer. The ICMD Query Caps indicate support and expose the list of the supported counters.
Hairpin Drop Counter	Added support for Hairpin Drop Counter.
User Context Object (DEVX)	This is a containerized sandbox per user, to access PRM command securely by using General Object commands, UMEM and UCTX contexts. The allowed functionalities of this capability depend on the user permissions. The following functionalities are still managed by the Kernel: • Resource cleaning • UCTX stamping • Blocking the physical address and IRQ from these UCTX

DEVX Support for Asynchronous Events	Added support for reporting the supported affiliated and unaffiliated asynchronous events to DEVX users through the command interface.
